EU Citizen (Greek passport) in Athens, Greece

Education & Certificates

- B.S. in Computer Science, Quchan University of Technology Status - Graduated

Work History

AI Engineer & Full-Stack Developer at aim2balance.ai, Germany

Nov 2025 to Sep 2026

- Created an EU-hosted AI chat service from scratch and owned it from 0 to 1, in TypeScript, running in production, that pays for reforestation out of the energy and water each chat uses.
- Designed the LLM gateway in Python on LiteLLM and FastAPI, one OpenAI-compatible API in front of several EU model providers for chat, embeddings, speech and images, hosted on Azure and GCP, and users still got answers when a provider went down.
- Wrote the LiteLLM callback that turned every provider's token price into one internal cost unit, which let the wallet charge customers correctly for every model without anyone keeping a price table per model.
- Set up the multi-agent AI orchestration on LangGraph and LangChain: a router agent works out what the user wants and hands off to specialist agents with tool calling, agent memory and MCP (Model Context Protocol) tools.
- Used agentic coding tools (Claude Code with custom skills, OpenAI Codex, Cursor) to write and review the code in an Agile process.
- Added RAG on PostgreSQL with pgvector, with a cap on lookups per answer, so the agents answered from the company's own documents at a predictable cost.
- Developed the EUR billing backend in Node.js (NestJS, Express) with REST APIs on MongoDB, with provider markup, a reforestation fee and a currency buffer on every request, and Stripe wallet top-ups that recharge exactly once, so no customer was ever charged twice.
- Metered the energy, water and CO2 of every AI chat with EcoLogits formulas, and built a Chrome extension that shows people the same environmental cost for their ChatGPT, Claude and Gemini use.

Full-Stack Developer at Zoof-it, Netherlands

Mar 2025 to Feb 2026

- Built Jeofferte, a service marketplace, from an empty repo to production and owned it from 0 to 1: Next.js and NestJS in TypeScript on PostgreSQL with a REST API and Stripe payments, so customers found nearby suppliers and paid in one place.
- Shipped Roofcast, a property prediction market, from scratch as Tech Lead: Solidity smart contracts on Polygon behind a JavaScript web app with wallet login, where users trade on where property values will go.
- Rebuilt Meshi's food-ordering interface from a legacy codebase in React with HTML and CSS (Tailwind), owning the UI/UX design in Figma, and pages loaded faster for people ordering food.
- Worked cross-functionally across frontend, backend and UI/UX in a small Agile team with sprints and code review, and built an automated agent that filled in company profiles at sign-up

Senior Frontend Developer at Exmodules

Sep 2024 to Feb 2025

- Developed a real-estate web app with token creation in Next.js, React and TypeScript with CSS (Tailwind), shipping reusable components (a generic data hook, a CRUD table) so new screens took less code to build.

Senior Frontend Developer at Intex exchange

Nov 2022 to Aug 2024

- Delivered a crypto exchange web app in React, Next.js, Node.js and TypeScript on MongoDB, with live market charts, order management and real-time trading data over WebSocket, and added a PWA caching layer that made pages open faster for traders.
- Standardised the team's development patterns behind a custom component library in JavaScript and CSS, and new features shipped in fewer days.

Frontend Developer at Panikar Academy

Mar 2020 to Sep 2022

- Coded a personality-assessment platform in React, Next.js, Node.js and TypeScript with a GraphQL API for the academy's students, and tuned the Webpack build so pages loaded faster.

Frontend Developer at 3gaam

Feb 2019 to Feb 2020

- Launched 3gaam Planning & Consulting, an AI-driven study-resource platform, in React and TypeScript, and fixed the GraphQL schema and resolver bugs that were blocking the team.
